This diagnostic repair manual has been prepared especially for familiarizing service personnel with the testing, troubleshooting and repair of the vertical home standby systems. Every effort has been expended to ensure that the information and instructions in the manual are both accurate and current. The Rotor is driven by the engine at a constant speed through a pulley and belt arrangement. All generator models in this manual utilize a 2-pole Rotor, i.e., one having a single north and a single south pole. This type of Rotor must be driven at 3600 rpm for a 60 Hertz AC output, or at 3000 rpm for a 50 Hertz output.
