Study Design. The Trial of Routine Aspiration Thrombectomy with PCI versus PCI Alone in Patients with STEMI (TOTAL) was an international, investigator-initiated, multicenter, prospective, randomized trial of upfront manual aspiration thrombectomy with the Export catheter (Medtronic) versus PCI alone. These are trials in which the new drug is given to small groups of patients with a given condition (usually about 20 per trial). The aim of phase II trials is to establish the efficacy of different doses and frequencies of administration. Statistical Overview for Clinical Trials Basics of Design and Analysis of Controlled Clinical Trials Presented by: ... placebo controlled superiority trial • New drug is not worse (in terms of efficacy), by a ...

- There are many other types of trial designs which we won't go into detail e.g. various

Can we agree on best practice for publishing raw clinical trial data? An important step forward will be to prepare widely agreeable guidance on preparing raw data for publication and recommendations for researchers on handling retrospective and prospective trial data: a challenge the editors of this journal are currently undertaking.
